

Birdwatching Report

Birdwatching Report - September 2024

During the recent expedition, several bird species were observed across multiple regions. Below is a summary of the sightings:

- **Crows**: We observed a large group of crows near the forest edge. Their presence was notable due to their loud cawing.
- **Sparrows**: The sparrow population appeared to be thriving, with several nests observed in the shrubs.
- **Ostriches**: In the savannah region, a small group of ostriches was spotted grazing.
- **Eagles**: Two majestic bald eagles were seen soaring high above the mountains.
- **Hummingbirds**: A rare sighting of hummingbirds occurred in the flower garden, where they were feeding on nectar.
- **Penguins**: Along the coast, a colony of penguins was seen waddling and diving into the ocean.
- **Hawks**: A few red-tailed hawks were perched atop tall trees, scanning for prey.
- **Owls**: During the night survey, we encountered several owls, their eyes glowing in the dark.
- **Robins**: Robins were frequently observed, hopping on the ground searching for worms.
- **Flamingos**: A flock of flamingos was seen in the wetlands, their pink plumage reflecting in the water.

Overall, the diversity and number of bird species in the area indicate a healthy and vibrant ecosystem. The presence of such a wide variety of birds showcases the ecological richness of this region.
